

SUMMARY OF CHANGES – V0.21-DRAFT

Article 3 (Thoroughfares): classification corrections, a recalibrated Main Street cross-section, a numbered inventory, and a new rule that scales required engineering to the road type. Builds on v0.20-draft.

THOROUGHFARE CLASSIFICATION (§5 INVENTORY)

- **Academy Hill** is now **Neighborhood Street (S3)** end to end; two of its segments had been mis-typed (as a Rural Road and as a Highway Commercial road).
- The end of **Stonebridge Circle** is now **Rural Road (R2)**, matching Timber Lane (it had been mis-typed as a Neighborhood Street).
- The **Route 1** segment between Lewis Hill / Lynch Road and Woods Island Road is now **Rural Highway (R5)**, matching the rest of the corridor.

INVENTORY TABLE (EXHIBIT 3.1)

- Every row is now **numbered (1–215)**, for easy reference.

MAIN STREET (S1)

- The cross-section is narrowed to a downtown-realistic width: **sidewalks 6 ft, planting strips 2–6 ft** (3 ft typical), and the **right-of-way recomputed to 50–62 ft** (about 56 ft typical). Travel lanes and on-street parking are unchanged; the cross-section drawing is updated to match.
- A note was added to the Main Street page: like the Highway Commercial (R4) and Rural Highway (R5) Types, **Main Street follows a State-owned route – U.S. Route 1B – and MaineDOT has jurisdiction over the traveled way within its right-of-way**. Main Street keeps its full Town design standards.

NEW THOROUGHFARES (§6): ENGINEERING SCALED TO THE ROAD TYPE

New streets and roads now require a level of engineering and oversight that matches their Type, instead of one standard for all (new Table 3.5):

- **Basic** – Lane (S4), Alley (S5), Rural Lane (R3): an applicant-prepared plan, no engineer’s stamp; Town review and inspection.
- **Engineered** – Village Street (S2), Neighborhood Street (S3), Connector Road (R1), Rural Road (R2): engineer-stamped plans, engineer-supervised construction, and inspection.
- **State** – Main Street (S1), Highway Commercial (R4), Rural Highway (R5): MaineDOT engineers and oversees the roadway; the Town reviews the streetscape.

Regardless of Type, the Town still reviews and inspects **every** new thoroughfare; any **stream or Shoreland crossing** must be engineered; a road offered to the Town as a public way must meet the Town’s acceptance standards; and the reviewing authority may require more engineering where site conditions warrant. (Adding this rule shifts the later §6 subsections – Design Standards, Construction, and Acceptance – down one letter.)

EMERGENCY-VEHICLE TURNAROUNDS (§6)

- A **dead-end thoroughfare longer than 150 ft must provide a turnaround** – a hammerhead, cul-de-sac, or approved equivalent – sized for the largest emergency vehicle serving the Town. This restores a standard from the former Road, Driveway & Entrance Ordinance.

DEFINITIONS (ARTICLE 9)

- The thoroughfare-related definitions added for Article 3 (Cartway, Thoroughfare, Street, the Type names, etc.) are now **merged alphabetically** into the main definitions list – they had been grouped in a separate section at the end. The **Alley** and **Driveway** entries were updated to their current Article-3 forms.

LAYOUT

- Removed **two redundant blank pages** that had been appearing before the District Standards spreads (the integrated draft is now 116 pages with a single front-matter blank).

NOT CHANGED

- **“Cartway”** was reviewed but kept: it is already a defined term in the Code (the full improved surface – travel lanes, parking, and shoulders), distinct from the traveled way.

This release includes the integrated Code (full draft), the standalone Article 3, a full redline of the integrated draft showing every change since v0.20, and this summary – each as both PDF and markdown.
